Measured phase p: time, throughput and batching gain
Time shading: +/- 1 SD; phase throughput is not system throughput
(a) Batch processing time
$T_p(N)$ [s]
Batch size N [tx]
(b) Processing time per transaction
$T_p(N)/N$ [s/tx]
Batch size N [tx]
(c) Equivalent phase throughput
$\Lambda_p(N) = N/T_p(N)$ [tx/s]
Batch size N [tx]
(d) Throughput elasticity
$\gamma_{\Lambda,p}(N) = d\ln\Lambda_p/d\ln N$
Throughput increases
Throughput decreases
Batch size N [tx]
