Throughput elasticity: comparison on identical intervals
Phase: prove; logspace and large calibration designs
(a) logspace: interval elasticity
(b) large: interval elasticity
(c) logspace: prediction error
(d) large: prediction error
$\bar{\gamma}_{\Lambda,p} = \Delta \ln \Lambda_p / \Delta \ln N$
Elasticity error: predicted - observed
Interval midpoint $\sqrt{N_i N_j}$ [tx]
rapidsnark
snarkjs
Observed
Affine (power term = 0)
One held-out endpoint
Both endpoints held out
Both endpoints in calibration
Largest calibration size
